Mercaptopurine for inflammatory bowel disease (IBD) patients

Why am I prescribed mercaptopurine?
This is a drug that affects the immune system in the body. It has been shown to be beneficial in reducing symptoms in patients with severe chronic inflammatory bowel disease, which has not responded to steroids alone or in patients dependent on high doses of steroids to control their symptoms.

How do I take mercaptopurine?
It is taken as a tablet that must be swallowed whole with plenty of water.

The exact number of tablets you take will vary depending on your weight and response to treatment. Your doctor will advise you on exactly how many to take.

How long will mercaptopurine take to work?
It may take between six and 12 weeks before you get a good response to mercaptopurine, so it is important to keep taking the treatment regularly.

Do I need any special checks/tests whilst on mercaptopurine?
It is important that your doctor can check to see if the treatment is working and also to reduce the side-effects of treatment. In order to do this you will need regular blood tests whilst on the treatment.

The tests you will require are:
Following initial baseline tests the ongoing tests that you will require are:
a full blood count (FBC) and liver function tests (LFTs) every two weeks for two months then monthly for four months, then if stable three monthly thereafter.

There may be other tests you require on top of these from time to time.

Record the results in the patient held record book given to you by the hospital doctor/specialist IBD nurse. It is important to bring this book to clinic appointments and to any GP appointments you may have.
Are there any side-effects?

Diarrhoea, nausea and mild aches and pains may occur initially but should settle within two weeks.

Other side-effects are more rare.

If the following side-effects occur at any time but particularly if they occur after recently starting treatment or increasing your dose, you should contact your GP, hospital doctor or specialist IBD nurse immediately for further advice.

- Feeling generally unwell
- Dizziness, headaches, drowsiness
- Vomiting
- Fever
- Muscle and joint pains
- Jaundice
- Skin rashes
- Hair thinning

Other problems such as reduced bone marrow activity may lead to an increased risk of infections, anaemia.

Special warnings/precautions

- Mercaptopurine should be avoided if you have previously had an allergic reaction to it.
- If you are considering becoming pregnant or become pregnant whilst on mercaptopurine, speak to your doctor or specialist nurse as soon as possible.
- If you develop an infection, fever, unexplained bruising or bleeding at any time report these to your GP or specialist IBD nurse (01223 257212) immediately.
- You should avoid excessive sunbathing as there are increased risks of skin problems (including skin cancer), whilst you are taking mercaptopurine. Use a high factor sun screen in the summer (at least Factor 15).

Are there any problems taking mercaptopurine with other medication?

- Mercaptopurine may interact with some other drugs, so it is important that you tell your GP, hospital doctor, specialist IBD nurse and pharmacist about any other tablets you are taking.
- If you are purchasing any drugs over the counter then please tell the pharmacist that you are on mercaptopurine.
- You should avoid certain types of vaccinations (live vaccines) whilst on mercaptopurine. Your GP, hospital doctor or specialist IBD nurse will be able to advise you on this.
Further information

This leaflet is only a guide. Further information may be obtained from the manufacturer’s patient information leaflet that you will get with the drug and also from your hospital doctor, GP, specialist nurse.

If you have side-effects or problems with your medication you can contact the specialist IBD nurse on 01223 257212.

We are now a smoke-free site: smoking will not be allowed anywhere on the hospital site. For advice and support in quitting, contact your GP or the free NHS stop smoking helpline on 0800 169 0 169.
